

Hi, I faced a couple of errors

1. Ever since protobufjs has been upgraded from v5 to v6, there is this repeated not a function error. So I had to edit the packages.json in order to get the correct npm installation.
2. There was some error with the server.js file because of which even though it showed that it was running, the link wouldn't load. As can be seen below where the terminal shows the server running, but I am not able to load it. The server was hosted at local host, and I tried to run it with the server name local host, 192.168.1.4(IP of master), and 127.0.0.1(local IP) through my browser but it wasn't successful

Therefore, I created a new server.js file. However, while this server.js file was able to load everything, the slave didn't follow the master, I think this was because the master HTML was not creating commits to the server. I tried to reconfigure the hosts file to resolve the domain, but that didn't seem to make a difference either.
