My first attempt at installing Peruse a rue was not successful. I followed the instructions on the readme of the repo on github, but there were some outdated instructions that I had to overcome.

First, simply clone the lg-peruse-a-rue repository, rather than the one mentioned in the instructions, as this is outdated.

Second, there are no instructions on the readme for hosting the server. I initially simply hosted on localhost and expected the view synchronization to happen on 2 computers. Obviously, this did not work. Then, I realized my mistake and hosted lg-peruse-a-rue through ngrok, which is a free to use service.

After this, I visited my url on 2 other computers and changed the yawoffset parameters on both, and it worked!
