How I did task with mplayer

1. I take a look on liquid galaxy wiki in section panoramic video

2. I download and install mplayer on Linux (master machine) and Windows (slave)

3. I again take a look on wiki and found udp parameters for view synchronization.

4. I try to run them and that work but had the same view on all machines.

5. I try to use -vocrop. That didn't work and return an error with a bad parameter.

6. I noticed that in lg has command to lunch synchronized player

7. I found command and run it.

8. Next problem was with video size.

9. Videos were played but the size of the video was bad because the proportions are for vertical screens.

10. I found 4k NASA free videos and run one of them with right proportions.
