liquidgalaxy.eu Structure

Scheme:

- Home

- About

- Liquid Galaxy's forum

    - Issues

    - Development & Bugfixing

    - Free Topic Zone

- Projects

- Documentation

As a potential user of liquidgalaxy.eu, I would like to see the following sections implemented on it.

First of all, there could be a "Home" that serves as a landing page with photo galleries and some news about the project. It should also have a scheme of all sections on it.

The second section should be a page explaining the Liquid Galaxy project while giving some basic instructions on how to install it and also to include a link to the Liquid Galaxy Core and other repositories in Github. Also a link to the wiki and a comparison between Liquid Galaxy's subprojects (core, LGxEDU, the upcoming social care programme HAPIS...) would be nice.

The next section I've come up with would be the core of liquidgalaxy.eu from my point of view. It might be called Liquid Galaxy's forum and as its name transmits would be a community forum for the English community. In this forum, users could create topics and comment in them. As all forums, this would need some moderation and featuring systems. Those could be easily solved by following th model of other forums like Reddit or StackOverflow which use an upvote and downvote system for featuring and also grant active users with points. The admins with some individuals with lots of points (granted because of solving questions, getting upvotes, editing some question, spell check..) would moderate the forum ensuring it will be a respectful place with everyone.

One subsection of the forum could be issues, a place where users were able to help each other by posting and resolving issues in many different fields (installation, network issues...) but of course they would have to be about liquid Galaxy.

The next subsection might be development. In here people will be able to create posts about code optimization and app development for the Liquid Galaxy project.

Finally, a free topic zone would be cool, as users would discuss about aspects of the project itself or even share any curiosities about it creating a healthier community.

Off forum there would be two more tabs. The first one is called projects and it should be a panel-like page in which users could participate on projects that involve Liquid Galaxy and even fund some local installations. This would maybe create some local communities.

The second tab might be documentation. In here users with a good level of English could create, modify and post documentation about the Liquid Galaxy project and also about other user projects that are found in the projects tab.

Finally, I must say that I've based on other great open source projects like Ubuntu which has got a community forum that in my opinion, makes it easier to cope with some common issues or even talk about its development.
